

Combinations

1. Statement

Given an array of size N , generate and print all possible combinations of R elements in array.

For example, if input array is $\{1, 2, 3, 4\}$ and R is 2, then the output should be $\{1, 2\}$, $\{1, 3\}$, $\{1, 4\}$, $\{2, 3\}$, $\{2, 4\}$ and $\{3, 4\}$.

2. Input

The input contains only one test case as described below.

The first line contains two integers, N and R ($1 \leq N, R \leq 1000$) specifying the number of elements and the number of sub-elements. The second line contains the N objects which are separated by space.

3. Output

Output the list of all possible combinations of R elements, each combination on a line by itself.

The list and its elements are arranged from lowest to highest value -sorted ascending, using its position.

4. Sample Input

Example 1

```
4 2
1 2 3 4
```

Example 2

```
6 3
hola hello salut aloha namaste konichiwa
```

5. Sample Output

Example 1

```
1 2
1 3
1 4
2 3
2 4
```

Example 2

```
hola hello salut
hola hello aloha
hola hello namaste
hola hello konichiwa
hola salut aloha
hola salut namaste
hola salut konichiwa
hola aloha namaste
hola aloha konichiwa
hola namaste konichiwa
hello salut aloha
hello salut namaste
hello salut konichiwa
hello aloha namaste
hello aloha konichiwa
hello namaste konichiwa
salut aloha namaste
salut aloha konichiwa
salut namaste konichiwa
aloha namaste konichiwa
```
